The present sequence is the 98kDa putative outer membrane protein from Chamydia pneumoniae. The genomic sequence was amplified using two Chamydia pneumoniae. The genomic sequence was amplified using two PGR primers. The 5' primer contains a NoI restriction site, a ribosome binding site, an initiation codom and a sequence close to the 5' end of the 98kDa putative outer membrane protein coding sequence. The 3' primer contains the sequence encoding the C-terminal sequence of the putative outer membrane protein and a BarGI restriction site. The stop codon was excluded and an additional nucleotide was inserted to obtain an in-frame creminal flusion which the Histidine tag. The PGR product was cloned into a eukaryotic expression vector (pCA-My-His) by restricting both the vector and the PGR product with NoII and BamHI and performing a liquiton reaction. This expression vector was injected intramensularly and intramasally into mice, which were subsequently incoulated with Chlamydia pneumoniae. The chlamydial lung titers of the immunised mice membrane protein can be used as a vaccine to provide protection against Chlamydia infections, especially Chlamydia pneumoniae infections. ô 999 99 540 600 9 360 420 420 480 480 120 120 180 GFSSLSFIASPGSSITTGKGAVSCSTGSLSLTKNVSLLFSKNFSTDNGGAITAKTLSLTG 180 240 240 300 360 9 QSYDILELKASGTVTSTAVTPDPIMGEKFHYGYQGTWGPIVWGTGASTTATFNWTKTGYI PNPERIGSLVPNSLWNAFIDISSLHYLMETANEGLOGDRAFWCAGLSNFFHKDSTKTRRG TTMSALFSENTSSKKGGALQTSDALTITGNQGEVSFSDNTSSDSGAAIFTEASVTISNNA KVSFIDNKVTGASSSTTGDMSGGAICAYKTSTDTKVTLTGNQMLLFSNNTSTTAGGAIYV 24) KVSFIDNKVTGASSSTTGDMSGGAICAYKTSTDTKVTLTGNQMLLFSNNTSTTAGGAIYV KKLELASGGLTLFSRNSVNGGTAPKGGAIAIEDSGELSLSADSGDIVFLGNTVTSTTPGT KKLELASGGITLFSRNSVNGGTAPKGGAIAIEDSGELSLSADSGDIVFLGNTVTSTTPGT NRSSIDLGTSAKMTALRSAAGRAIYFYDPITTGSSTTVTDVLKVNETPADSALQYTGNII FTGEKLSETEAADSKNLTSKLLQPVTLSGGTLSLKHGVTLQTQAFTQQADSRLEMDVGTT LEPADTSTINNLVINISSIDGAKKAKIETKATSKNLTLSGTITLLDPTGTFYENHSLRNP LEPADISTINNLVINISSIDGAKKAKIETKATSKNLTLSGTITLLDPTGTFYENHSLRNP QSYDILELKASGTVTSTAVTPDPIMGEKFHYGYQGTWGPIVWGTGASTTATFNWTKTGYI TLENI PGTGTALTKSCFNNTKGDLTFTGNGNSLLFQTVDAGTVAGAAVNSSVVDKSTTFT GPSSLSFIASPGSSITTGKGAVSCSTGSLSLTKNVSLLFSKNFSTDNGGAITAKTLSLTG TIMSALFSENTSSKKGGAIQTSDALTITGNQGEVSFSDNTSSDSGAAIFTEASVTISNNA FTGEKLSETEAADSKNLTSKLLQPVTLSGGTLSLKHGVTLQTQAFTQQADSRLEMDVGTT 1 MKSSFPKFVFSTFALFPLSMIATETVLDSSASFDGNKNGNFSVRESQEDAGTTYLFKGNV TLENI PGTGTAITKSCFNNTKGDLTFTGNGNSLLFQTVDAGTVAGAAVNSSVVDKSTTFI Gaps ; 0 100.0%; Score 4774; DB 21; Length 928; 100.0%; Pred. Its amino acid sequence was deduced from DNA (see AAK06820) isolated from a C. pneumoniae expression library. The invention provides 12 novel surface exposed proteins, Omp4-Omp15 (see AAW88417-28), and nucleic acid sequences encoding them (see AAX06816-27). A new species specific test is claimed that is used to identify mammals (including humans) infected with Chlamydia pneumoniae. The test comprises detecting antibodies specific for omp4-Omp15 or detecting nucleic acid fragments encoding these outer membrane proteins, especially by PCR. The proteins are also used in the diagnosis of C. pneumoniae infection in mammals. The Species-specific test for identifying mammals infected with Chlamydia pneumoniae - comprises detecting antibodies specific for outer membrane proteins of C. pneumoniae or nucleic acids encoding membrane protein 8; surface exposed protein; antigen; liagnosis; vaccine; atherosclerosis; asthma. caquences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CWL029), and ABL91184-ABL91373 represent DNA encoding them The proteins are predicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as also involved in the development of cardiovascular diseases such as cherosclerosis, coronary artery disease, carotid artery stenosis, myocardial infarction, cerebrovascular disease, aortic aneurysm, claudication and stroke. The proteins and nucleic acids of the invention prevention or treatment of chlamydial infections for the detection of pneumoniae infections. The proteins may also be used in PGR, branched DNA probe assay or blotting techniques for determining Chlamydia pneumoniae gene expression. The present sequence represents a precifically claimed Chlamydia pneumoniae protein of the invention.

AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and ls thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

  116 STTFIGFSSLSFIASPGSSITT--GKGAVSCSTGSLSLTKNVSLLFSKNFSTDNGGAITA 173
   This polypeptide comprises the novel 97.2 kDa surface exposed protein Omp5 of the human respiratory pathogen Chlamydia premorniae. Its amino acid sequence was deduced from DNA (see AAXO6817) isolated from a C. pneumoniae expression library. The invention provides 12 novel surface exposed proteins, Omp4-Omp15 (see AAXO6816-27). A new species specific test is claimed that is used to identify mammals (including humans) infected with Chlamydia pneumoniae. The test comprises detecting antibodies specific for omp4-Omp15 or detecting nucleic acid fragments encoding these outer membrane proteins, especially by PCR. The proteins are also used in the diagnosis of C. pneumoniae infection in mammals. The nucleic acids and proteins can also be used in the immunization of mammals the nucleic acids being particularly useful as DNA vaccines for effecting in vivo expression of antigens. The vaccines may also prevent atherosclerosis and bronchial asthma, which are possibly associated with C. pneumoniae.

  Dequences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CWL029), and ABL91184-ABL91373 represent DNA encoding them. The proteins are predicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as attery disease, carotid artery stenosis, coronary artery disease, acrtic aneurysm, wocardial infarction, carebrovascular disease, acrtic aneurysm, claudication and stroke. The proteins and nucleic acids of the invention prevention or treatment of chlamydial infections, particularly Chlamydia pneumoniae infections. The proteins may also be used in PCR, branched Chlamydia pneumoniae gene expression. The present sequence represents a pneumoniae gene expression. The present sequence represents a specifically claimed Chlamydia pneumoniae protein of the invention.

   This sequence is a Chlamydia antigen of the invention, designated CPN100635. The nucleic acids (and their complementary sequences) may be used as diagnostic agents for detecting the presence of nucleic acids encoding Chlamydia antigens in samples according to standard methods, and therefore, for diagnosing Chlamydia infections. For example, they may be used as primers and probes for diagnostic polymerase chain reaction (PCR) assays. Antisense sequences may be used to down regulate expression of the proteins and may be used to down regulate conclet acids may also be used to produce the protein antigens they nucleic acids may then be used as antigens for the production of antibodies or avaccing to standard recombinant DNA methodologies. The proteins may then be used as antigens for the production of antibodies (i.e. as vaccines) for preventing infection by Chlamydia. The antibodies may also be used as diagnostic reagents for detecting infections. Chlamydia is a pathogen implicated in the development of (for example) community acquired pneumonia, upper respiratory tract disease (especially bronchitis and sinusitis, asthmatic bronchitis, adult-onset asthma and acute exacerbations of asthma in adults.

   This polypeptide comprises the novel 96.7 kDa surface exposed protein Omp9 of the human respiratory pathogen Chlamydia pneumoniae. Its amino acid sequence was deduced from DNA (see AAXO6821) isolated from a C. pneumoniae expression library. The invention provides 12 novel surface exposed proteins, Omp4-Omp15 (see AAXO6816-27). A new species specific test is claimed that is used to identify mammals (including humans) infected with Chlamydia pneumoniae. The test comprises detecting antibodies specific for Omp4-Omp15 or detecting nucleic acid fragments encoding these outer membrane proteins, especially by PCR. The proteins are also used in the diagnosis of C. pneumoniae infection in mammals. The
  Species-specific test for identifying mammals infected with Chlamydia pneumoniae - comprises detecting antibodies specific for outer membrane proteins of C. pneumoniae or nucleic acids encoding these proteins

   AAY69362-69 represent Chlamydia pneumoniae polypeptides. The polypeptides are present in the bacterial membrane structure, in the setternal vicinity of the membrane structure, in the inclusion membrane structure, in the external vicinity of the inclusion membrane structure, and in the external vicinity of the inclusion membrane structure, and in the cytoplasm of the infected cell. The polypeptides may be used to prevent, treat and detect the presence of Chlamydia infection and/or the presence of Chlamydia in a sample. The polypeptides may also be used to induce an immune response in a mammal. The vaccine response in a mammal. Antibodies directed against the polypeptides may also be used therapeutically to treat and/or prevent a Chlamydia

This sequence is a Chlamydia antigen of the invention, designated CC CPN100635. The nucleic acids (and their complementary sequences) may be used as diagnostic agents for detecting the presence of nucleic acids encoding Chlamydia antigens in sample according to standard methods, and therefore, for diagnostic plamydia infections. For example, they may be used as primers and probes for diagnostic polymerase chain reaction CFC sassays. Antisense sequences may be used to down regulate expression of the proteins and may be used to down regulate. The concier acids may also be used to produce the protein antigens they encode according to standard recombinant DNA methodologies. The proteins may then be used as antigens for the production of antibodies (i.e. as vaccines) for preventing infection by Chlamydia. The antibodies may also be used as diagnostic reagents for detecting infections. Chlamydia is a pathogen implicated in the development of (for example) community acquired pneumonia, upper respiratory tract disease (especially bronchitis and sinusitis, asthmatic bronchitis, adult-onset asthma and acute exacerbations of asthma in adults.

885 AA;

Sequence

Nucleic acids encoding polypeptide antigens from Chlamydia useful for preventing, diagnosing and treating diseases such as community acquired pneumonia, bronchitis, sinusitis and asthmatic bronchitis, adult-onset

  This polypeptide comprises the novel 98.4 kDa surface exposed protein Omp10 of the human respiratory pathogen Chlamydia preumoniae. Its amino acid sequence was deduced from DNA (see AAX06822) isolated from a C. pneumoniae expression library. The invention provides 12 novel surface exposed proteins, Omp4-Omp15 (see AAX06842-27). A new species specific test is claimed that is used to indentify mammals (including humans) infected with Chlamydia pneumoniae. The test comprises detecting antibodies specific for Omp4-Omp15 or detecting nucleic acid fragments encoding these outer membrane proteins, especially by PCR. The proteins are also used in the diagnosis of C. pneumoniae infection in mammals. The modelic acids and proteins can also be used in the immunization of mammals the nucleic acids being particularly useful as DNA vaccines for effecting in vivo expression of antigens. The vaccines may also prevent atherosclerosis and bronchial asthma, which are possibly associated with C. pneumoniae.

Sequences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CWL029), and ABL91184-ABL91373 represent DNA encoding

```
them. The proteins are predicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as atherosclerosis, coronary artery disease, carotid artery stenosis, myocardial infarction, cerebrovascular disease, actic aneurysm, claudication and stroke. The proteins and nucleic acids of the invention may be used in vaccines and pharmaceutical compositions for the proteins and sincertions, particularly Chlamydia pneumoniae infections. The proteins may also be used in the detection of Chlamydia pneumoniae, and the nucleic acids may be used in PCR, branched CN may probe assay or blotting techniques for determining Chlamydia pneumoniae expression. The present sequence represents a pneumoniae continually claimed Chlamydia pneumoniae protein of the invention.

  This sequence is a chlamydia antigen of the invention, designated cPN100638. The nucleic acids (and their complementary sequences) may be used as diagnostic agents for detecting the presence of nucleic acids encoding Chlamydia antigens in samples according to standard methods, and therefore, for diagnosing Chlamydia infections. For example, they may be used as primers and probes for diagnostic polymerase chain reaction (PCR) assays. Antisense sequences may be used to down regulate expression of the proteins and may be used to treat infections. The nucleic acids may also be used to produce the protein antigens they proteins may then be used a santigens for the production of antibodies (i.e. as vaccines) for preventing infection by Chlamydia. The antibodies may this be used as diagnostic reagents for detecting antibodies antibodies may also be used as diagnostic reagents for detecting antibodies antibodies may also be used as diagnostic reagents for detecting the antibodies and the production of antibodies antibodies may also be used as diagnostic reagents for detecting the antibodies and the production of 
  infections. Chlamydia is a pathogen implicated in the development of (for example) community acquired pneumonia, upper respiratory tract disease (especially bronchitia and sinustis, asthmatic bronchitis, adult.-onset asthma and acute exacerbations of asthma in adults.

```
The present sequence is CPN100640, the 98 kDa outer membrane protein from Chlamydia pneumoniae. Chlamydia pneumoniae is a common cause of community acquired pneumonia and upper respiratory tract symptoms and diseases. Including bronchitis and sinusitis. It also has an association with atherosclerosis and aethma. The 98 kDa outer membrane protein is a C. pneumoniae-specific antigen which can confer immune protection against chlamydial infection. The nucleotide sequence encoding the protein or the protein itself may be administered as a vaccine to prevent or treat infection and they may also be used to diagnose infection. The gene encoding CPN100640 was amplified from Chlamydia pneumoniae genomic DNA

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
